Mean, Median, Mode and Numpy submission

Now, find the mean and median of this data. In the code block below, write your code, and see if your result makes sense:

```
[2]: np.mean(incomes)
[2]: 99.72514934491956
[3]: np.median(incomes)
[3]: 99.46916051860356
```

This is pretty much the world's easiest assignment, but we're just trying to get your hands on iPython and writing code with numpy to get you comfortable with it.

Try playing with the code above to generate different distributions of data, or add outliers to it to see their effect.

```
[4]: plt.boxplot(incomes)
plt.title("Avg mean/median incomes")
plt.show()
```
